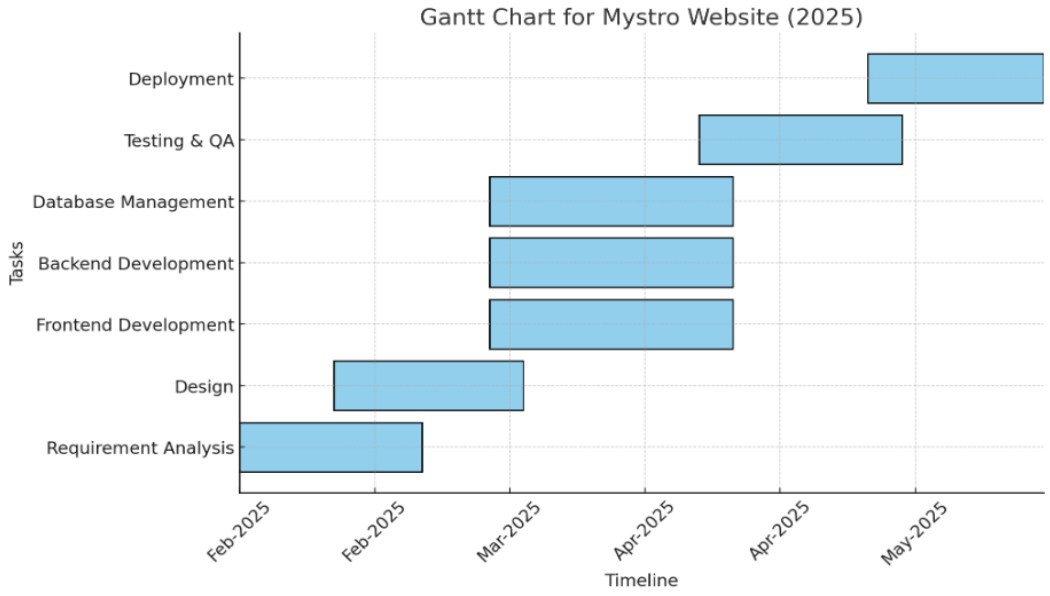
1. Project Planning & Management :-

- **Project Proposal :**
  - Mystro Website is a platform designed for book reservations and purchases. It provides a user-friendly interface where users can browse, reserve, and buy books from various libraries and individual sellers. The system ensures secure transactions and seamless functionality . Include key freatures :
  - Book listings with filtering and searching capabilities.
  - Reservation and borrowing facilities.
  - Secure online payment for book purchases.
  - User management for readers and book owners.

- **Project Plan :**

Timeline (Gantt chart) :



- **Task Assignment & Roles :**

Tasks will be distributed among team members as follows:

- Frontend Development: Building the user interface using HTML , CSS , JavaScript .
- Backend Development: Implementing business logic and APIs with .NET MVC .
- Database Management: Storing book listings, user details, and transactions in SQL Server.
- Testing & QA: Verifying system security and functionality.
- Project Management: Overseeing progress and ensuring goals are achieved.

- **Risk Assessment & Mitigation Plan :**

Potential risks include :

- System downtime
- Payment processing issues
- Security vulnerabilities

Mitigation strategies include:

- Implement high-availability servers.
- Use reliable payment gateways.
- Conduct regular security audits.

- **KPIs (Key Performance Indicators) :**

Success will be measured by :

- System response time
- Uptime percentage
- Successful transaction rate
- User retention rate
- Overall user satisfaction

---

2. Literature Review :

- **Feedback & Evaluation :**

The project was evaluated based on the following aspects :

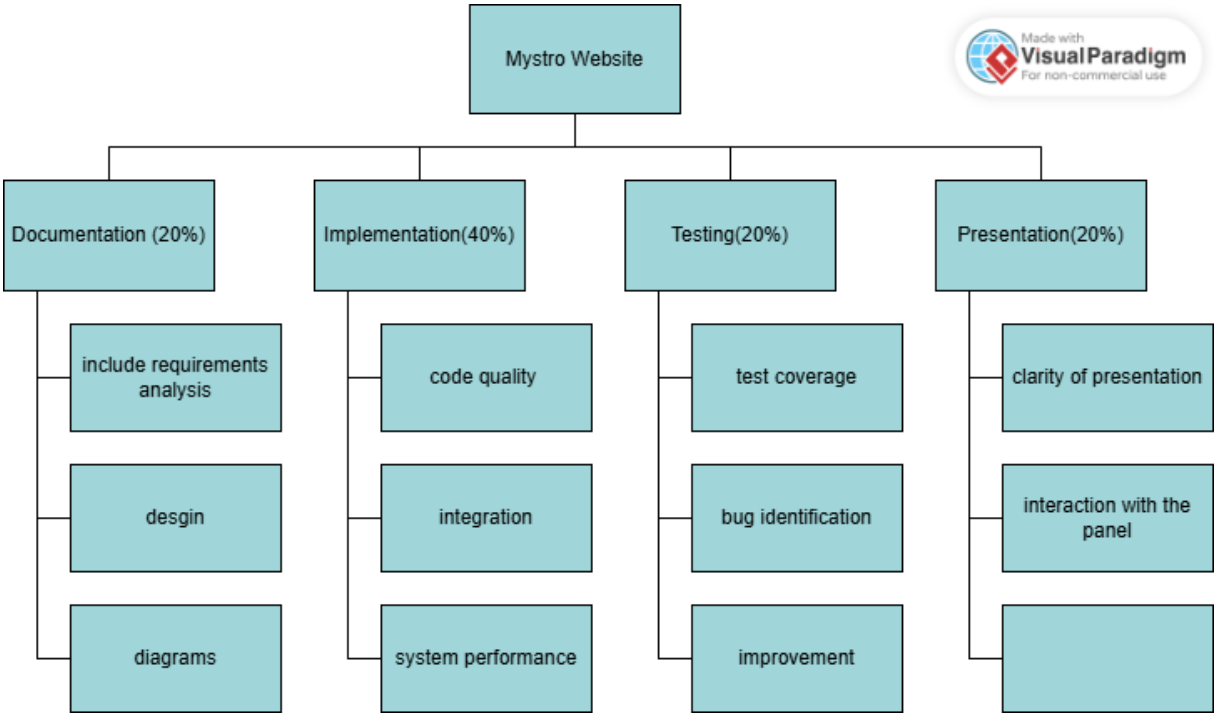
- **Clarity of Concept & Objectives**: The project effectively focuses on creating a seamless and secure platform for renting and selling cars online.
- **User Interface & Experience**: The inclusion of filtering and search features, along with support for both individual users and dealerships, was praised.
- **Technical Structure**: The use of **.NET MVC** and **SQL Server** provides a strong foundation for performance and security.
- **Security Considerations**: The importance of integrating reliable payment gateways and conducting regular security audits was emphasized.

- ## Suggested Improvements :

  - **System Performance Optimization**: Implementing **caching** and optimizing database queries using **LINQ** can enhance responsiveness.
  - **Mobile App Support**: Expanding the platform to include a mobile application could improve accessibility for users.
  - **Enhanced User Experience**: Add book reviews, comparison features, and alert notifications for new books.
  - **Security Enhancements**: Strengthening **data encryption, protection against SQL Injection, and improving authentication mechanisms**.

- ## Final Grading Criteria :

The project will be graded based on the following criteria:



3. Requirements Gathering :

- **User Stories & Use Cases :**

User Stories for Mystro System :

1. Reader

As a reader, I want to search for books based on title, author, and genre, so that I can find books of interest.

As a reader, I want to reserve a book for a specific duration, so that I can borrow it conveniently.

As a reader, I want to securely pay for book purchases, so that I can own them.

2. Book Owner (Librarian/Individual Seller)

As a book owner, I want to list my books with details and price, so that I can attract potential readers.

As a book owner, I want to manage my book listings, so that I can update availability and pricing.

3. Administrator

As an administrator, I want to manage user accounts, approve book listings, and monitor transactions, so that I can ensure smooth operation.

As an administrator, I want to generate reports on sales, reservations, and user activity, so that I can analyze performance and optimize services.

Use Case for Mystro System :

- **Reader**: Searches for books → Reserves or buys a book → Completes payment.
- **Book Owner**: Lists books → Manages listings → Updates book details**.**
- **Administrator:** Manages users & listings → Monitors transactions → Generates reports.

- ## Functional Requirements :

The system will include the following core features :

- User Authentication & Profile Management.
- Car Listing, Search, and Filtering.
- Car Booking & Payment Integration.
- Admin Panel for User and Transaction Oversight.

- ## Non-Functional Requirements :

Key non-functional requirements for performance, security, usability, and reliability:

Category	Requirement
Performance	Fast response times and scalable infrastructure.
Security	Encrypted transactions and secure user authentication.
Usability	Intuitive user interface and mobile responsiveness.
Reliability	99.9% uptime with backup and recovery mechanisms.

- **Stakeholder Analysis :**

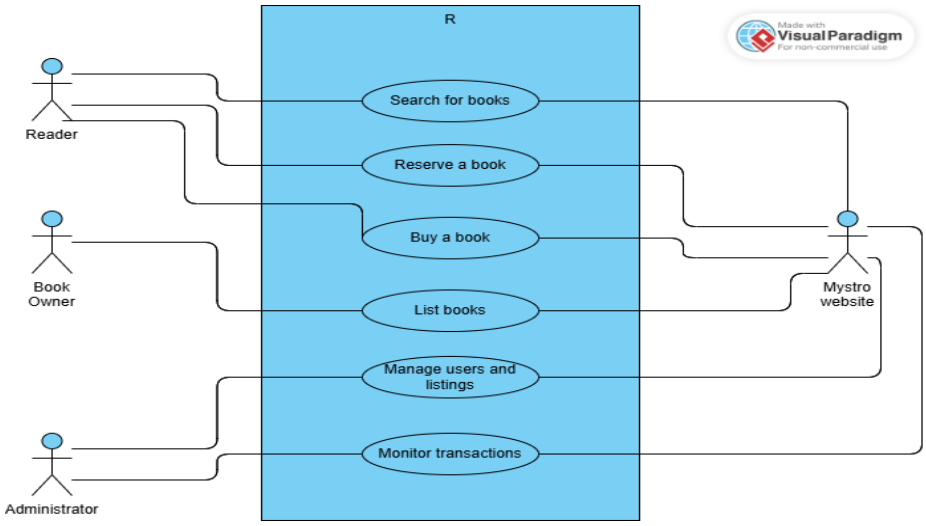
The key stakeholders and their needs in the Mystro system:

- Readers : Need easy book discovery and reservation.
- Book owners : Need efficient book management.
- Adminisrators : Need control over platform security and performance.

---

4. System Analysis & Design :

- **Problem Statement & Objectives – Define the problem being solved and project goals.**
  - Use Case Diagram & Descriptions :



The **Use Case Diagram** you provided represents the interactions between users and the system. It includes key actors and their respective functionalities:

Actors & Use Cases:

- **Reader :**
  - **Search for books –** Users can search using filters like title, author, and category.
  - **Reserve a book** – Users can place reservations for a limited period.
  - **Buy a book –** Users can complete purchases securely**.**

- **Book Owner :**
  - **List books –** Sellers can list books with details like author, price, and availability.

- **Administrator :**
  - **Manage users and listings** – The admin oversees user accounts and book availability .
  - **Monitor transactions** – The admin ensures secure transactions and fraud prevention.

- **Mystro Website :**
  - Serves as the platform where users interact with the system to perform various operations.
